

Insights and recommendations

During the first part of the training, I had a dataset about helpdesk tickets that take in IT or software related incidents/ issues. There were issues of incidents being resolved in an untimely manner by the Helpdesk team causing stagnation in the workflow due to IT problems. As a result, I was tasked with creating a report with summaries and providing insights from the dataset to identify this bottleneck.

From the data I was able to identify that the majority of the tickets were breaching SLA, this is likely because 79% of the ticket within the dataset was handled by one agent in the team, I then provided suggestions for improvement: a long term growth orientated solution where the more experience senior member to create a clear and well documented SOP (Standard Operating Procedure) where it is easier for less experience members to upskill themselves so they are able to distribute the workload more evenly. If the current workforce is insufficient or if a more immediate solution is required, I recommended hiring additional experienced personnel that is familiar with the work process and systems to handle the helpdesk tickets. This would require less time to train, and mostly for acclimatising to the current workflow of the teams and would become an immediate and effective work force

My analysis revealed that by following SLA standards this could potentially reduce overall time taken from 8 hours overdue to 2 hours SLA Standard this would considerably increase overall productivity of the company.
